PROJECT PRESENTATION

Company Directory

A secure, searchable directory of our partner agents and their contacts — with controlled access for staff and simple tools for the administrator.

Prepared by John Moises Pesigan · September 2026

What this presentation covers

1 Overview & problem

What the system is, who uses it, and why it exists.

2 Solution & features

What it does for staff and for the administrator.

3 Screens

Real screenshots of the running application.

4 How it works

User journeys, architecture, data and security.

5 Progress & status

What has been built, and where it stands today.

6 Next steps

Roadmap options, business impact and summary.

All figures come from the project itself: source code, a database snapshot of 25 Sep 2026, the version history and the live site. Items that could not be checked are marked **Not verified**.

One place to find the right agent – and the right person to contact

What it is

An internal web application that holds our overseas partner agents (freight forwarders) by country, with their contacts, network memberships, status and assigned sales reps.

Who uses it

Staff who need to find and contact agents. Each account sees only the countries, companies and sales columns granted to it.

Who manages it

An administrator, who loads country workbooks from Excel, manages user accounts and access, and monitors data quality.

Status

Live Running on PythonAnywhere with automatic deployment from GitHub.

137

agent companies · 474 contacts

4

countries — India (107 companies, real data); Singapore, Thailand, USA (10 sample records each)

8

user accounts · 3 access levels

Database snapshot, 25 Sep 2026. The live database may differ.

Agent information lived in spreadsheets

The system imports one Excel workbook per country. The problems below are the ones its features are built to solve.

Scattered by country

Each country's agents sit in a separate workbook, so finding "an agent in Chennai on WCA" means opening and searching several files.

All-or-nothing sharing

A shared workbook exposes every column to everyone — including which rep from which of our brands handles each agent.

Manual status checks

Expired network memberships, pending KYC and inactive agents must be spotted by reading dates and statuses row by row.

Uneven data quality

Missing emails and phones, shared addresses and unreadable dates are hard to see across hundreds of rows.

Risky updates

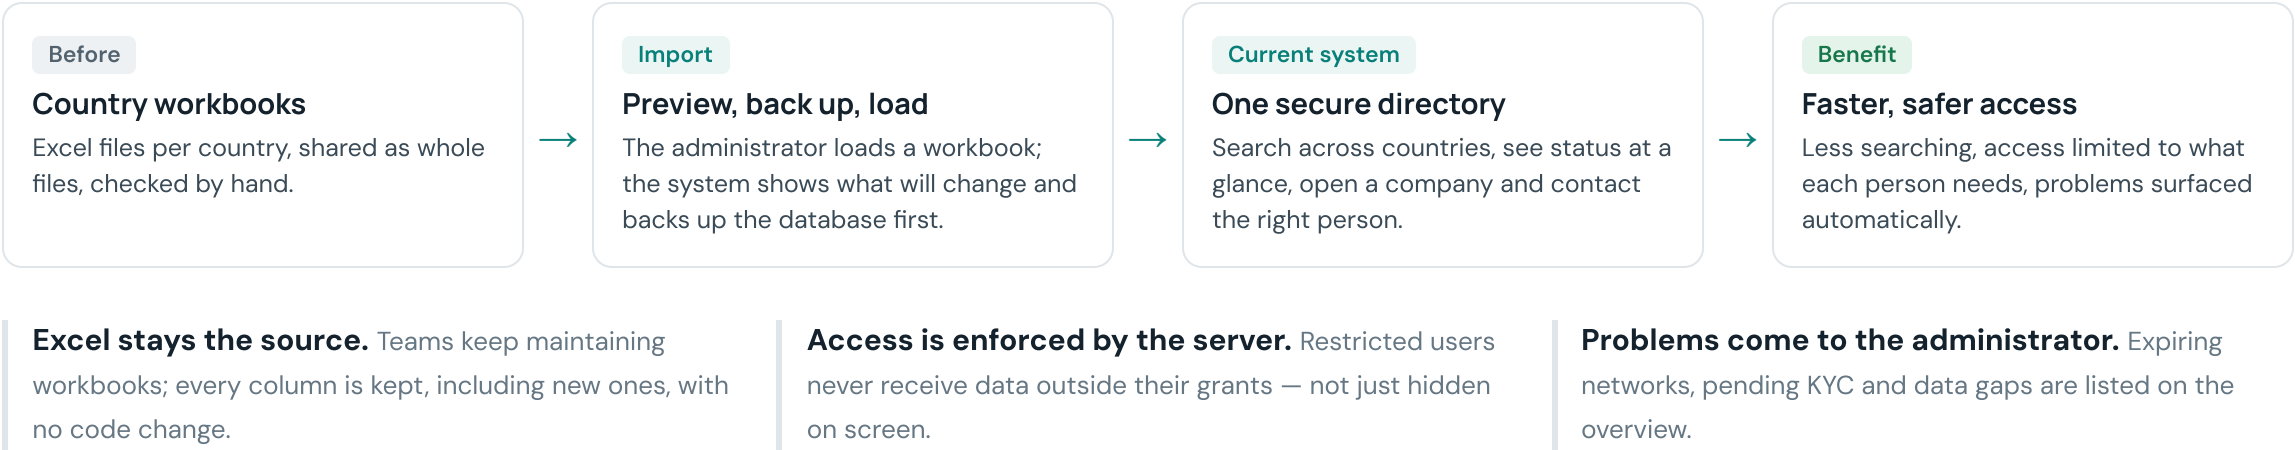

Replacing a country's data by hand can silently drop or duplicate companies, with no record of who changed what.

Slow to reach people

Once the agent is found, the right contact's email or phone still has to be located and copied from another sheet or cell.

From spreadsheets to a controlled, searchable directory

For everyone: find and reach agents quickly

FEATURE	WHAT IT DOES	WHO	BUSINESS BENEFIT
Directory search	One box searches agent name, agent ID, city, state, country, network and contact name, role, email and phone. Exact agent-ID matches come first.	All users	Answers "who can we use in...?" in seconds.
Country filter & browsing	Narrow any search to a country, or browse a country's agents from the start page.	All users	Fast lane-by-lane lookup.
Status at a glance	Agent status, KYC and network expiry shown on every result and company page, e.g. Active KYC Pending .	All users	Avoids working with agents that are inactive or out of network.
Company profile	Key facts, contacts table with one-click copy and tap-to-call, and every workbook column grouped into sections.	All users	Everything about an agent on one page.
Recently viewed	Start page lists the agents a person opened recently (kept in their own browser).	All users	Quick return to ongoing work.
Self-service password	Users change their own password; other devices are signed out.	All users	Fewer requests to the administrator.

For the administrator: control, safety and oversight

Users & access

- Three levels: **User, Full Access, Admin**
- Per-country access with "**All companies, including future imports**" or hand-picked companies
- Per-user visibility of the four brand sales columns
- Users list shows last sign-in and how many companies each person can see

Safe Excel imports

- **Preview** before anything changes: new, removed and updated companies, skipped rows
- Automatic **database backup** before every import (newest 10 kept)
- Company IDs and user access survive re-imports
- Failed imports roll back and are recorded

Overview dashboard

- **Needs attention:** expired / expiring networks, KYC pending, inactive agents, unreadable dates
- Contact data quality, sales-rep coverage per brand, access overview
- Import health and recent admin activity

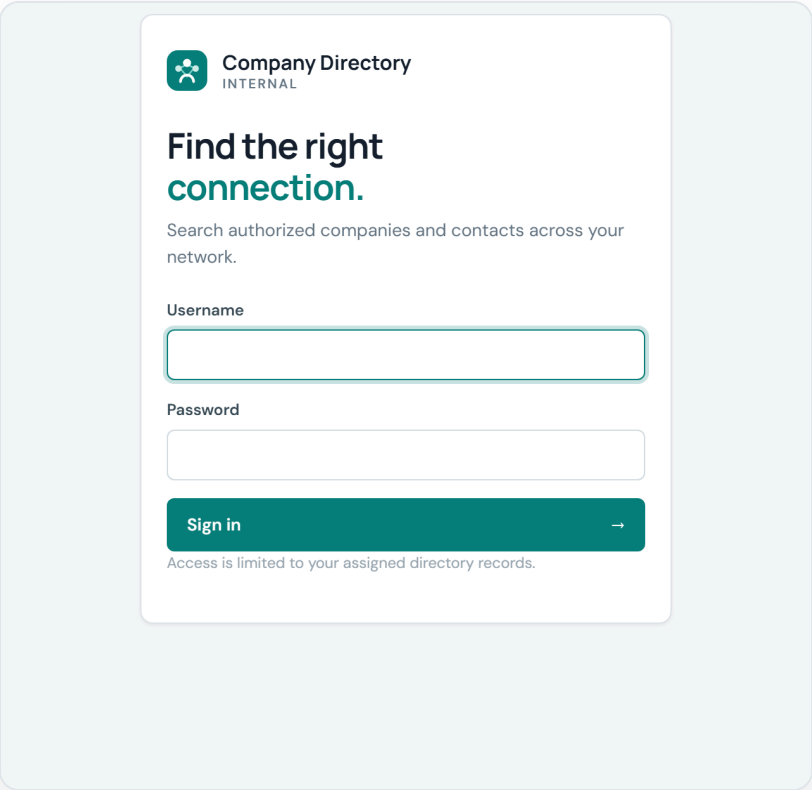

Records & exports

- Records page: every company with source file and row, filters and paging
- CSV export of companies (all workbook columns) and contacts, safe to open in Excel

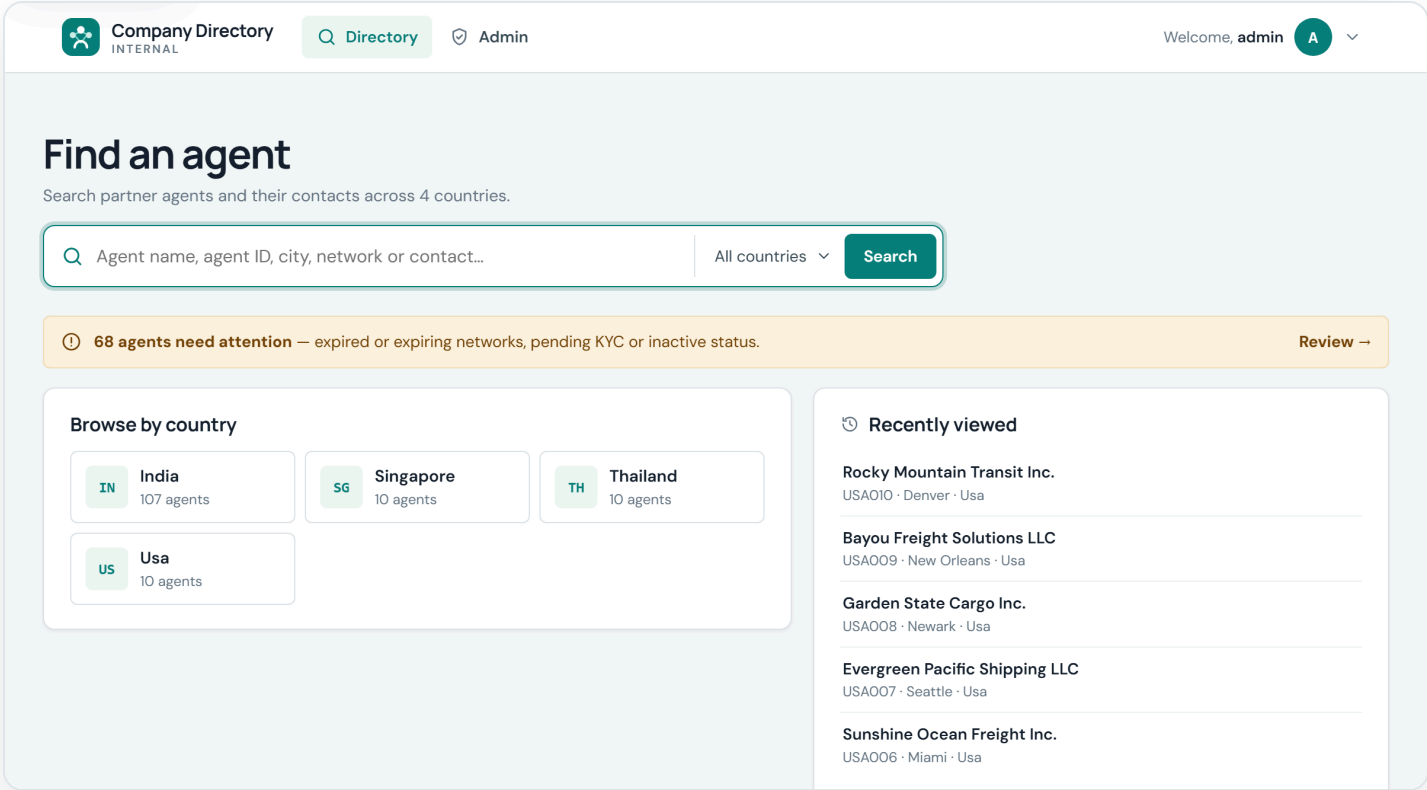

The application

Real screenshots of the current version. To protect partner contact details, the directory screens show the sample records (Singapore, Thailand, USA) included with the project.

Sign in and start page

Sign in. Personal accounts only; repeated wrong passwords are blocked for 15 minutes.

Start page. Search, country tiles with agent counts (only granted countries for restricted users), recently viewed agents, and — for admins — how many agents need attention.

Search results: scan, check status, contact

☐

Directory access

3 of 4

Tick each country this User may search. "All companies" also covers companies added by future imports, so the account needs no update after an import.

☐ Select all countries

✓ India 107 companies

☐ All companies incl. future imports

☒ Only selected 107 of 107

▼ Choose companies in India

☒ Select all in India

☒ 20Cube Global Logistics Private Limited

☒ 3Vb Shipptrans Private Limited

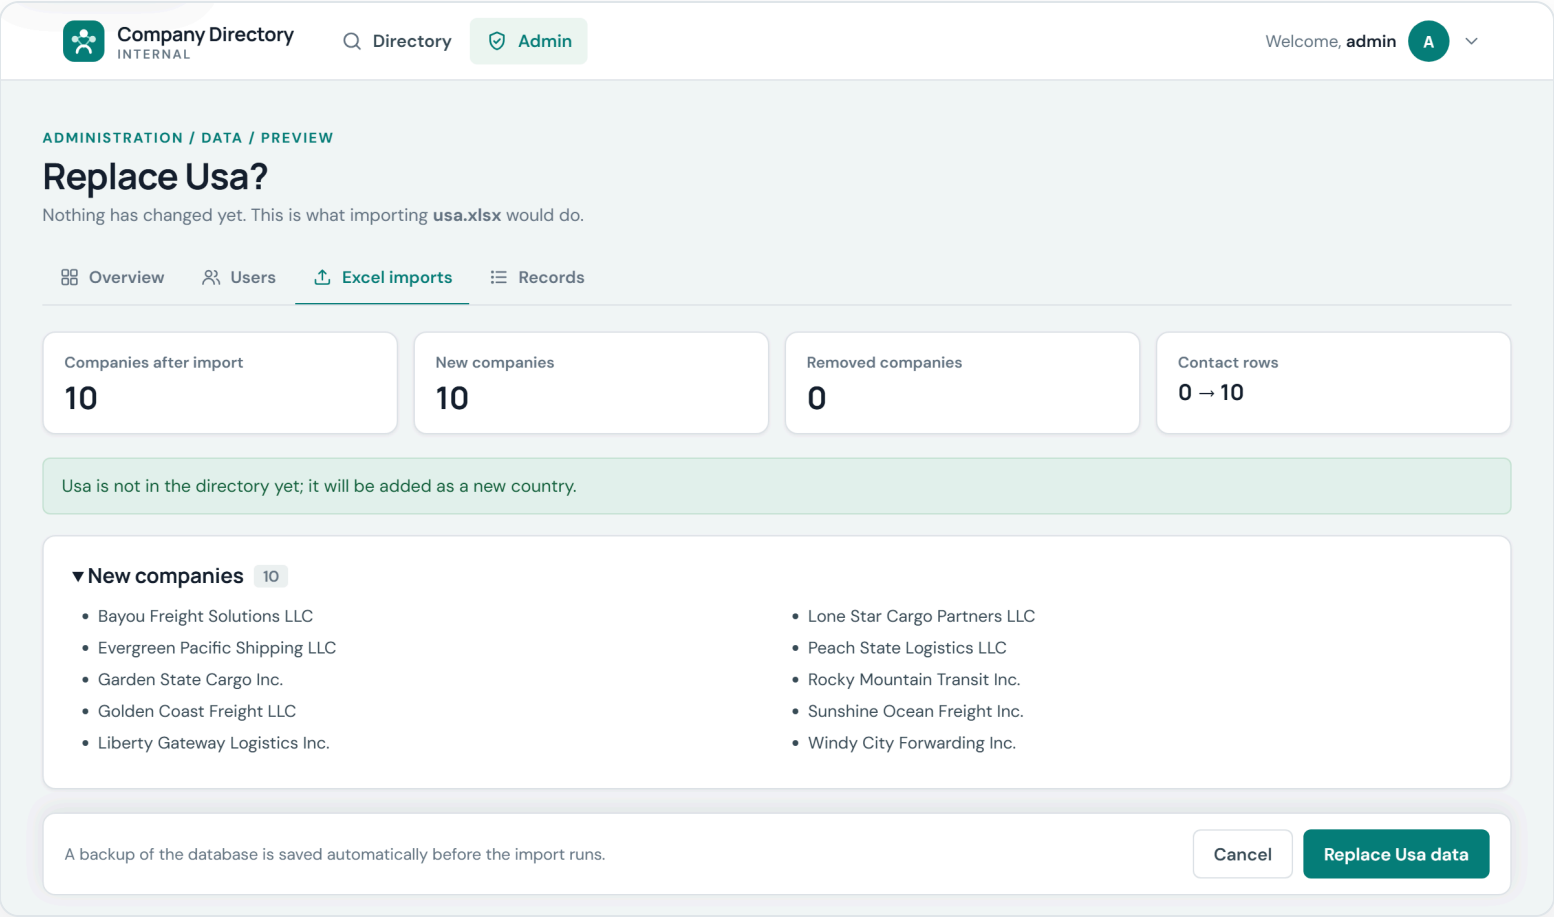

- ✓ **Sales columns** — switch each brand's rep column on or off per user
- ✓ **Countries** — tick the countries a user may search
- ✓ **"All companies, incl. future imports"** — new agents appear automatically
- ✓ Or **"Only selected"** companies, for tighter control

This account has all 107 India companies ticked one by one; switching India to "All companies" would also cover future imports.

Company Directory · Screens

15

Excel imports: preview before replacing

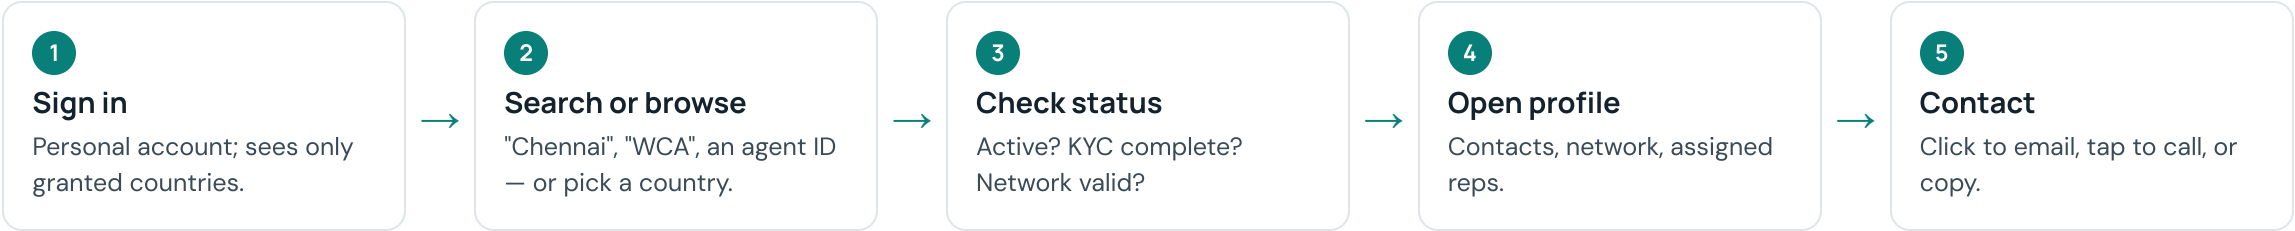

- ✓ **Preview first** — companies after import, new, removed, contact rows
- ✓ Lists the **companies to be added or removed** and rows that will be skipped
- ✓ Names users who would **miss new companies**
- ✓ **Automatic backup** before the change; full import history on the Imports page

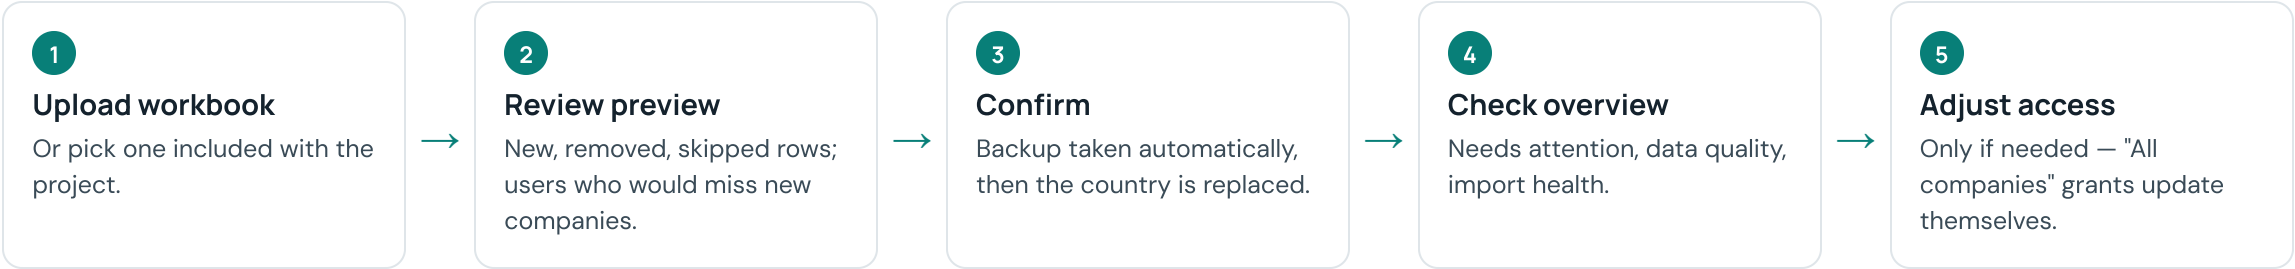

Preview of usa.xlsx in an environment where USA was not yet loaded.

How people use it

Staff member – find an agent for a shipment

Administrator – update a country's data

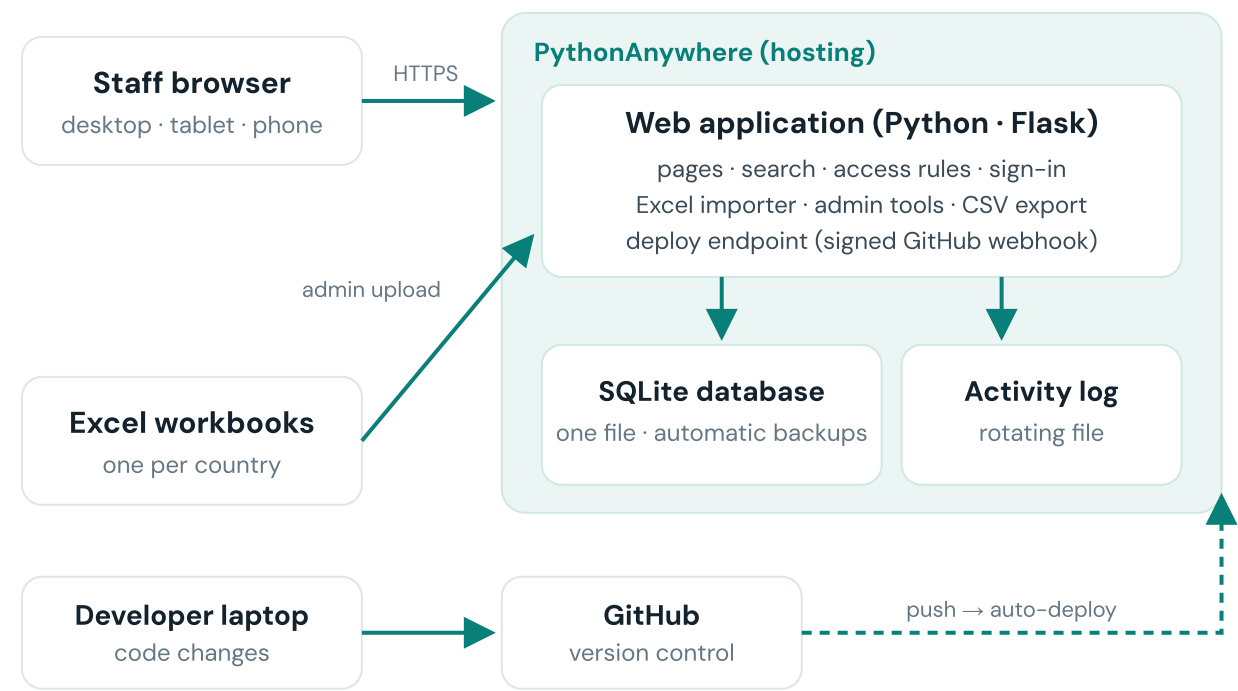

What changes for the administrator

TASK	WITH SPREADSHEETS ONLY	WITH COMPANY DIRECTORY
Share agent data	Send whole files; everyone sees every column	Grant countries, companies and sales columns per person; enforced by the server
Update a country	Overwrite a file; no view of what changed	Preview the difference, automatic backup, one-click confirm, history kept
New agents added	Re-share updated files with each person	"All companies" grants include new agents automatically; preview names anyone who would miss them
Spot problems	Read dates and statuses row by row	Overview lists expired / expiring networks, KYC pending, inactive agents and data gaps
Password resets	—	Users change their own; admin can reset and it signs out old sessions
Know who changed what	No record	Admin actions, imports and sign-in failures recorded; shown on the overview

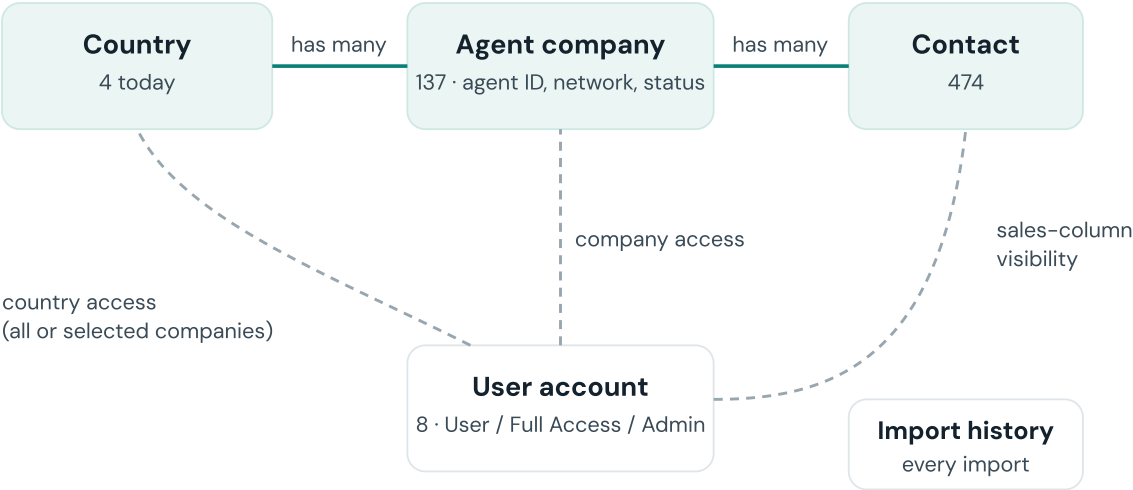

The "spreadsheets only" column describes working from the per-country workbooks the system imports; it is not a measured baseline.

A simple, low-maintenance setup

LAYER	TECHNOLOGY (VERIFIED)
Screens	Server-rendered HTML (Jinja2 templates), one stylesheet, small vanilla JavaScript; Google Fonts
Application	Python 3 · Flask 3 · Flask-WTF (form protection) · Werkzeug (password hashing)
Excel	openpyxl — reads .xlsx workbooks
Data	SQLite database (single file)
Hosting	PythonAnywhere (plan tier: Not verified)
Delivery	Git + GitHub; signed webhook pulls and reloads on every push to main
Quality	Automated test script — 209 checks

How the information is organised

Every Excel column is kept

Besides the main fields, each company and contact stores its full original row, so new workbook columns appear on the profile without programming.

Access lives with the data

Grants link user accounts to countries and companies; the database answers only with rows a user may see.

Passwords are stored only as one-way hashes. No credentials or keys are shown in this document.

Security: in place today, and recommended next

Implemented

- ✓ Personal accounts; passwords stored as strong one-way hashes (bcrypt); minimum 12 characters
- ✓ Sign-in throttling: 5 failures per user/address, 30 per address, 15-minute lock
- ✓ Sessions end after 2 h idle / 12 h total; a password change signs out every other session
- ✓ Access checks built into every database query (country, company, sales columns)
- ✓ Form protection against cross-site request forgery
- ✓ Secure, HTTP-only session cookies (confirmed on the live site)
- ✓ Browser security headers (no framing by other sites, no content sniffing)
- ✓ Uploads limited to .xlsx up to 16 MB; file names sanitised
- ✓ CSV exports neutralise spreadsheet formulas; log lines cannot be forged
- ✓ Deploy endpoint accepts only GitHub requests signed with a shared secret

Recommended

- **Force HTTPS** on the host — plain http was not redirected when checked on 25 Sep
- **Repository history:** the first commit included a database copy and an old key; keep the repository private or clean its history
- **Default accounts:** confirm the seeded passwords were changed (the overview warns if not)
- Run the automated tests before every deploy
- Keep an off-site copy of database backups

Fast for today's data, safe when things go wrong

Performance (in place)

- ✓ Database indexes on company name, agent ID, contact name, email and phone
- ✓ Paged results (20 per search page, 50 per records page); long searches capped
- ✓ Slow password checks done once, not on every overview load (~300 ms → ~65 ms, measured locally)
- ✓ Signed-in user looked up once per request
- ✓ Server-rendered pages with one small script and one stylesheet

Reliability (in place)

- ✓ Imports run as one transaction: a failure leaves the previous data untouched
- ✓ Automatic backup before each import; newest 10 kept
- ✓ A failing overview panel shows a notice instead of breaking the page
- ✓ Friendly pages for expired forms, oversized uploads and server errors
- ✓ Activity log rotates at 1 MB so it cannot fill the disk
- ✓ 209 automated checks covering access rules, imports, security fixes and screens

Page timings were measured on a laptop against a copy of the database; live response times on the host are Not verified.

What has been built

VERSIONS 1–4 · BEFORE GIT

Foundation

- Flask + SQLite directory, sign-in, admin area
- Excel importer keeping every column
- Country + company access; sales-column permissions
- First interface refinement

VERSIONS 5–7 · BEFORE GIT

Hardening & oversight

- Re-imports keep IDs and access
- Security review: 11 fixes (sessions, throttling, headers...)
- Admin overview with 7 panels; CSV export
- Shared design system

25 SEP 2026 · MORNING

Delivery pipeline

- Code on GitHub; live on PythonAnywhere
- Automatic deploy on every push (signed webhook)
- Sample USA data; search by agent ID

25 SEP 2026 · VERSIONS 8–9

Productivity & redesign

- "All companies" access, import preview + backups
- Self-service passwords, country filter
- Status on results; contacts-first profile
- New start page; one consistent stylesheet

Dates for versions 1–7 are not recorded (they predate version control) and are Not verified; the first user accounts in the database were created on 21 Sep 2026. Versions 8–9 and the pipeline are dated from the Git history.

Where the project stands

Completed

- Directory search, filters, status, profiles
- Accounts, 3 roles, per-country/company/column access
- Safe imports: preview, backup, history
- Admin overview, records, exports
- Live hosting with automatic deploy
- Phone and tablet layouts

In progress

- No partially built features in the code.
- Operational follow-ups: switching existing users to "All companies" where intended; confirming default passwords changed.

Remaining

- Force HTTPS on the host
- Scheduled daily backup and off-site copy
- Tests run automatically before deploy
- Replace sample countries with real data when available

Technical debt

- Early Git history holds a database copy and old key
- Agent data can only be corrected through Excel re-imports
- Sign-in throttle memory resets on restart
- Activity history is a log file, not a searchable table
- Country names come from file names ("Usa")

Roadmap options

IMPROVEMENT	BUSINESS VALUE	WHO BENEFITS	COMPLEXITY	PHASE
Security & operations basics	Force HTTPS, daily backup with off-site copy, tests before deploy	Company · administrator	Low	Next
Data clean-up workflow	Work through the 12 unreadable expiry dates, 22 contacts without email and 249 without phone the overview already lists	Staff get reliable contacts	Low–Medium	Next
"My agents" by sales rep	Each brand's rep sees the agents assigned to them (data already in the sales columns)	Sales staff	Medium	Later
Quick corrections in the app	Fix a phone or email without re-importing a whole country	Administrator	Medium	Later
Searchable audit history	Who changed access or data, and when, kept in the database	Management · administrator	Medium	Later
Expiry reminders	Alert before network memberships lapse (depends on hosting plan allowing email — Not verified)	Administrator · sales	Medium	Later
Company sign-in (single sign-on)	Staff use their existing work accounts; no separate passwords	All staff · IT	Medium–High	Future

Value to the business

Time saved

One search across all countries replaces opening several workbooks; contacts can be emailed, called or copied directly.

Controlled information

Each person sees only what they need; commercial columns stay with the people entitled to them.

Fewer mistakes

Status on every result; on the snapshot date the overview surfaced 38 attention items in the real India data (expired or expiring networks, inactive agents, unreadable dates).

Less admin work

Imports are previewed and backed up; "All companies" access removes re-granting after every import; users reset their own passwords.

Scalable

New countries are added by uploading a workbook — no code change; new columns appear automatically.

Maintainable

Small, standard technology; changes go live automatically after a push; 209 automated checks guard behaviour.

Benefits are qualitative. No time or cost savings have been measured, so none are claimed.

Summary

WHAT WE BUILT

A secure internal directory of our partner agents and their contacts, live on the web.

ACCOMPLISHED

137 companies and 474 contacts loaded; 8 accounts; automatic deployment; 209 automated checks.

WHY

Agent information was spread across country workbooks, shared all-or-nothing, and checked by hand.

NEXT

Force HTTPS and scheduled backups, clean up the data gaps the system found, then rep-focused views and in-app corrections.

WHAT IT PROVIDES

Cross-country search with status, contacts-first profiles, per-person access, safe imports and an oversight dashboard.

DIRECTION

Grow from a reliable lookup tool into the day-to-day hub for agent information across all countries.

✔ **Decision points:** approve the "Next" roadmap items, and confirm which countries' real workbooks should replace the sample data.
